The Aircel DHT Series (20 - 125 scfm) high inlet temperature refrigerated air dryers are designed for air-cooled reciprocating type air compressors, this compressed air dryer combines an oversized refrigerated circuit, high-efficiency heat exchangers and separator into a single compact unit, with single point air in/out, drain and electrical connections.

These dryers can accept compressed air up to 205°F and provide clean dry air at the outlet. Our high inlet temperature refrigerated dryers have been designed specifically for use with smaller reciprocating air compressors that typically do not incorporate an aftercooler.

DHT Series Features
- Maximum inlet temperature of 205°F.
- Maximum inlet pressure of 200 psig.
- Outlet pressure dew point range of 40-50°F.
- No air-cooled aftercooler required for compressor.
- Environmentally Friendly R-134a Refrigerant.
- Space-saving compact design.
- Fully automatic operation.
- Power on-light.
- On/Off switch.
- Power Cord.

DHT Series Benefits
- Environmentally friendly R-134a refrigerant.
- Advanced scroll technology.
- Highly efficient moisture separation.
- Timer drains standard.
- NEMA 1 standard.
- Precise dew point at any load.
- Reduced power and energy consumption.
- Copper brazed stainless steel multi-plate or aluminum block heat exchangers.
The Compressed Air and Gas Institute (CAGI) has developed standards to protect users of compressed air & gas equipment. The published standard capacities are based on 175 psig inlet pressure and 180°F inlet temperature. When these conditions vary, a given DHT dryer will be able to purify either more or less compressed air than its standard capacity. There are two ways in which this information can be used. The first is to start with a specific DHT dryer size and recalculate its capacity based on the known operating conditions using the correction factors given below. The second is to select the proper DHT dryer size based on applying the correction factors to the flow rate for a given set of operating conditions. Examples based on applying the correction factors are shown below.

### DHT Series

#### Capacity Correction Factors

**To Size the Dryer Capacity for Actual Conditions**

\[
\text{Adjusted Capacity} = \text{scfm} \times C1 \times C2 \times C3 \times C4
\]

To calculate the capacity of a given dryer based on non-standard operating conditions, multiply the standard capacity by the appropriate correction factor(s).

**Example:**

- **Dryer Model:** DHT-100
- **Standard Capacity:** 100 scfm
- **Actual Operating Conditions:** 95°F ambient temperature: \( C1 = 1.03 \)
- **150°F inlet temperature:** \( C2 = 1.06 \)
- **160 psig system pressure:** \( C3 = 0.96 \)
- **50°F required dew point:** \( C4 = 1.0 \)

\[
\text{Adjusted Capacity} = 100 \text{ scfm} \times 1.03 \times 1.06 \times 0.96 \times 1.0 = 104.8 \text{ scfm}
\]

**Capacity correction factors for differing ambient air temperature (C1)**

---

1 Capacity rated @175 psig, 180°F inlet, 100°F ambient, and a PDP of 50°F.

*Rated Load Amps (RLA) and Minimum Circuit Amps (MCA).*

Maximum ambient temp: 35°F - 120°F Maximum inlet temp: 205°F / Air pressure range: 30-200 psig

Due to a continuous program of product improvement, specification and dimensions are subject to change without notice.

### DHT Series

#### DHT-20

- Capacity: 20 scfm
- Connection: 1/2 inches FPT
- HP: 1/3
- RLA*: 7.2
- MCA*: 9.9
- Voltage: 115-1-60
- Dimensions: 15 x 16 x 16 inches
- Pressure max.: 200 psig
- Weight: 95 lbs
